

TexToPix Pictures that are talking by itself. Copyright (C) 2006-2010 by Boris A. Glazer. All Rights Reserved TexToPix can create pictures made from text. The main idea of TexToPix is quite simple. You get text, (phrases, words or even few characters), select an image that you like to mimic and program will generate an image that when viewed from a distance looks like the picture and when looked close - you may see every single character and read the text. Unlike most of ASCII-Art image programs (including our BG_ASCII), TexToPix uses a much more sophisticated approach. Main difference - you are not limited with fixed width font faces. Your Text-o-Pictures can be made from any font installed on your computer. You may create black and white, grayscale and even colored images. Resulted image can be saved as an raster Jpeg image file or as vector based PDF document. Visit the program's homepage: <http://www.mazaika.com/textopix.html> Send email to author: boris_a_g@hotmail.com System requirements: Mac computer with Mac OS X 10.4 or later.
